

For communication of software issues between collaborators, typically a picture tells a 1000 words and a video much more and is a lot less painful than trying to describe it via a text or email. To enable this form of communication, we've installed into the Ubuntu16.04 OS platform, Video Capture and Video Editing/Compositing software.

The Video Capture program is Kazam; the Video Editing program is Kdenlive. Both programs have icons on the program icon bar at left of the screen. Alternatively you can do a search in Dash to find and run them.

Good tutorial for use of Kazam can be found at: <https://www.youtube.com/watch?v=a78e3DjEYKY>

If you don't get audio; be sure to go into preferences and select the correct microphone. Without endorsing any particular microphone, one we know that is compatible with Linux and is available from Amazon for \$30:

Recording Microphone Usb Fifine Plug & Play Condenser Microphone For PC/Computer(Windows,Mac,Linux OX),Podcasting,Recording-Black(K058)

Similarly a good tutorial for using Kdenlive can be found at:
